vozmozhnoy roli iksodovykh kleshchey kak khraniteley i
perenoschikov chumnykh mikrobov.

Orig Pub : Tr. In-ta zool. i parazitol. AN KirgSSR, 1956, No. 5,
121-127.

Abstract : By biotests and individual inoculations of intestinal
contents on a nutrient medium an investigation was conducted
of the capacity of the mites Dermacentor pavlovskiyi,
Haemaphysalis warburtoni and H. punctata to become con-
taminated with pest bacteria when fed on infected guinea
pigs, to store pest stimulants and transfer it by biting

Title : AS KirgSSR
: Vertical Distribution of the Ixodidae in
Agricultural and Wild Animals in the South
of Kirgizia

Orig Pub : Tr. In-ta zool. i parazitol. AN KirgSSR, 1957,
vyp 6, 201-213

Abstract : On the classification basis of the natural
belts of Vykhodetz (1956), the following
distribution of the Ixodidae in the south
of Kirgizia are presented: (1) In the deep
hot valleys: Ixodes redikorzevi, Haemaphysalis

Card 1/3

sulcata, H. punctata, H. nimidiana, Boophylus
calcaratus, Dermacentor marginatus,
Rhipicephalus turanicus, Hyalomma asiaticum,
Hy. anatolicum, Hy. plumbeum, Hy. detritum,
Hy. dromedarii, Hy. scupense. (2) In the
hot foothills: besides the 13 species
indigenous to the valleys, one also finds
Hy. aegyptium. (3) In the mountains of
average height with tall-grass meadow and
meadow-steppe vegetation: H. sulcata, H.
punctata, D. marginatus, Hy. plumbeum, B.
calcaratus, Rh. turanicus. (4) Native to the
subalpine meadows are: D. pavlovskyi, D.
marginatus, H. warburtoni, I. crenulatus.
(5) The cold mountain valleys are characterized

Card 2/3

USSR / Zooparasitology. Mite and Insect Vectors of
Disease Agents. Acarids.

G

Abs Jour : Ref Zhur - Biologiya, No 5, 1959, No. 19704

by the same 4 species as the subalpine meadows. (6) In the alpine belt: D. pavlovskyi, H. warburtoni, I. crenulatus. (7) In the nut-bearing forests and bushes: I. redikorzevi, I. sp., H. sulcata, H. punctata, H. warburtoni, B. calcaratus, D. pavlovskyi, D. marginatus, Rh. turanicus, Hy. asiaticum, Hy. anatolicum, Hy. plumbeum, Hy. scupense, H. detritum. I. persulcatus, recorded in this zone, is an imported species. For some acarid species, the distribution is presented according to stations, hosts and season. -- N. A. Filippova

TITLE: Method of <u>measuring</u> the specific conductance of an ion exchanger in a granulated state		
SOURCE: AN SSSR. Sibirskoye otdeleniye. Izvestiya. Seriya khimicheskikh nauk, no. 2, 1965, 9-12		
TOPIC TAGS: electric conductivity, ion exchange membrane, <u>ion exchange resin</u>		
ABSTRACT: The specific conductance is measured directly after the granulated ion exchanger has been separated from the equilibrium solution by centrifuging. The exchanger is placed in a cell (see Fig. 1) where equilibrium is allowed to take place; the cell is then centrifuged, thermostated, and its resistance is measured, and from the latter, the specific conductance of the ion exchanger is calculated. The method was checked on a ground <u>ion-exchange membrane</u> . ⁷ The effect of the centrifuging rate on the cell resistance was determined. The method is recommended for application to resin membranes as well. The convenience of the thermostating of the cell makes this method applicable to studies of the change in the conductance of ion-exchange resins and membranes with changing temperature. Orig. art. has: 4 figures and 2 tables.

	REASON: This book is intended for engineers and scientific per-	
	sonnel, in the field of steel production.	
	CONTENTS: This is a collection of articles dealing with various as- pects of the production of steel, including the design of various as- pects of steel furnaces, thermal processes in the furnaces, thermodynamics of steel-making processes, technology of producing high-grade steel, and changes in the size and shape of ingots. Other topics discussed are the properties of chrome-manganese steels, effects on the improvement of ball-bearing steel, ingot defects, ingot quality, as determined by temperature of steaming, and shape of rolls, and certain aspects of steel rolling. Some of the articles are ac- companied by references, both Soviet and non-Soviet.

TITLE: Investigations on Improved Casting of Steel Into Large-Size
Sheet Ingots

PERIODICAL: V sb.: Vopr. proiz-va stali, Nr 5, Kiyev, AS UkrSSR, 1958,
pp 119 - 145

ABSTRACT: The authors investigated the connection between steel casting conditions and the development of cracks on the surface of sheet ingots of 12.8, 9.6 and 8.6 ton weight. It was established that the temperature was distributed most irregularly over the open metal surface during the filling of the mold. The crust temperature at the edges of the ingot was 40 - 80° lower than along the ingot axis. To obtain a normal ingot, the steel must have a high temperature and must be cast without a crust; eddy currents in the ingots during the pouring of the metal into the mold must be insignificant. The weight inflow of the steel into the mold

Card 1/3

Investigations on Improved Casting of Steel Into Large-Size Sheet Ingots

per unit of time must increase during the casting. The authors recommend a casting speed of 0.9 - 1.2 t/min for the lower part and a speed of 1.3 - 1.4 t/min for the upper part. Formulas are given to determine the optimum steel temperature at the moment of tapping. For casting 9.6 ton ingots it is: $t_{\text{tap}} = (t_1 + t_{\text{sol}}) / 2 + 85 + 70/1.5 \cdot W$, where t_{tap} is the steel temperature during tapping the furnace, t_1 is the temperature of liquidus, t_{sol} is the temperature of solidus, W is the weight speed of teeming in t/min.

Casting of steel with a smooth surface was carried out in experimental smelts at a tapping temperature of the steel of 1,620° - 1,650°C. It was established that the shape of the nozzle placed into the mold, had an effect on the formation of the crust on the surface of the metal ascending in the mold. It is recommended to use nozzles with rectangular or oval-shaped outlet cross-sections. The authors investigated heat flows from the ingot to the mold during casting. During the first minute the heat flows attain 20,000 to 25,000 kcal/min m²; during the following 2 - 3 minutes they decrease to 7,000 - 6,000 kcal/min m². In high-speed casting of relatively cold metal heat flows at the mold walls were irregularly distributed over the ingot height. Mostly the heat flows occurred in the zone of intensified circulation
